I help businesses identify one costly operational problem and build an AI-powered system to fix it — reducing lost leads, cutting admin overhead, and automating repetitive workflows — then stay on retainer to maintain, improve, and expand those systems over time.

EDUCATION

B.Sc. Software Engineering
Addis Ababa Science & Technology University (AASTU)
Addis Ababa, Ethiopia

IMPLEMENTATION STACK

Backend & APIs

NestJS Node.js REST APIs

WebSockets TypeORM

AI & Automation

RAG AI Agents Prompt Eng.

Knowledge Graphs Agentic Systems

Data & Storage

MySQL Neo4j MongoDB Pinecone

Redis

Integrations

Firebase Telebirr Chapa

Google OAuth LiveKit FHIR

Deployment

Docker AWS Traefik

GitHub Actions Linux

CERTIFICATIONS

AWS Solutions Architect – Associate
Oct 2024

AWS Cloud Practitioner
Nov 2023

Deep Learning Specialization – Coursera
Sep 2023

Software Design & Architecture – Coursera

Arabic CONVERSATIONAL

PROFILE

AI Implementation Engineer with a track record of turning business operational problems into working backend systems — from customer-facing automation and payment workflows to real-time communication platforms and data-driven recommendation engines. Delivered three production systems as sole backend engineer across logistics, healthcare, and e-commerce, each built end-to-end from architecture through deployment.

Experienced working within the SingularityNET / Hyperon ecosystem at iCog Labs, bridging research-level AI concepts and production engineering. AWS Certified. Licensed Software Developer under the Creative Media Authority, Abu Dhabi.

WHAT I BUILD FOR BUSINESSES

CUSTOMER-FACING AUTOMATION

- AI-powered intake, lead qualification, and after-hours response systems that capture business outside working hours.
- Chatbots and agents connected to real databases — not generic responses, but answers grounded in your actual data via RAG.

BACKEND SYSTEMS & WORKFLOW AUTOMATION

- End-to-end backend platforms covering bookings, scheduling, dispatch, payments, and notifications — built to replace manual coordination.
- Admin dashboards, automated reporting, and data pipelines that eliminate repetitive internal work.

INTEGRATIONS & DATA SYSTEMS

- Connecting existing tools — CRMs, payment rails, messaging platforms, document stores — into unified, automated workflows.
- Graph-based recommendation and search systems that surface the right information or product to the right person at the right time.

DELIVERED PROJECTS

ET Delivery — Logistics Dispatch Platform Dec 2024 – Jul 2025

Sole Backend Engineer · NestJS · MySQL · Docker · Firebase · Telebirr · Chapa

A logistics company needed a system to handle driver dispatch, bookings, corporate accounts, and payments without manual coordination. Built the full backend: automated driver assignment using geospatial availability logic, complete booking lifecycle from creation to completion, wallet and payment flows with Ethiopian payment rail integrations, and push notification workflows for real-time operational communication.

Eliminated manual dispatch coordination · Automated payment reconciliation · Enabled corporate account billing

Therapy Platform — Healthcare Operations Backend Apr 2025 – Apr 2026

Sole Backend Engineer · NestJS · WebSockets · LiveKit · Redis · Firebase · Google OAuth

A mental health platform needed to replace manual therapist scheduling, session management, and client communication with an automated system. Built therapist-client matching, session scheduling, group session management, real-time chat and call infrastructure, subscription-based access control, and automated notification flows for session events. Also designed FHIR-based referral integration architecture for hospital connectivity.

Automated therapist scheduling · Enabled real-time client communication · Built subscription revenue infrastructure

EBP — E-Commerce Platform with AI Recommendations Apr – Jul 2025

Sole Backend Engineer · NestJS · MySQL · Neo4j · Cypher · Docker

An e-commerce business needed a marketplace backend with intelligent product discovery. Built product and inventory management, cart and checkout flows for both guest and registered users, and a graph-based recommendation engine using Neo4j and Cypher — surfacing related products, personalized suggestions, and trending items from real user interaction patterns.

AI-powered recommendations from real behaviour data · Guest checkout reducing abandoned sessions

AREAS OF DELIVERY

Lead & Booking Automation Intake flows, dispatch systems, scheduling, notifications	Payment & Wallet Systems Telebirr, Chapa, subscriptions, transaction flows
AI Agents & RAG Systems Document Q&A, data-grounded responses, knowledge graphs	Real-Time Communication WebSockets, live call infra, push notifications, chat
Backend Platform Build Multi-role APIs, admin tooling, full deployment ownership	Data & Recommendation Graph modeling, personalization, behavioural data systems

HOW I ENGAGE

- Diagnose one costly operational problem and scope a working solution
- Build and deploy end-to-end — architecture, backend, integrations, infrastructure
- Deliver fast working demos before committing to full builds
- Available on monthly retainer for maintenance, improvements, and new automations
